I'm a beginner learning HTML, CSS, and JavaScript. Help me build a simple video-sharing website inspired by common video platforms.

Please write the complete code for my index.html file only. Create a homepage with a header containing a search bar, a sidebar with navigation links, and a grid of sample video cards. Each card should have a thumbnail, title, creator name, and view count.

Use a modern dark theme layout, but put all styling in a separate styles.css file and all JavaScript in a separate script.js file. Link those two files correctly in the HTML. Use original sample content and explain the code in beginner-friendly language.

Give me the entire code in one code block so I can copy it into VS Code.

Thought for 15s

Copy this into `index.html`. The comments explain the main parts; the styling and JavaScript stay in the separate files linked in the `<head>`.

HTML

```
<!DOCTYPE html>
<html lang="en">
  <head>
    <meta charset="UTF-8" />
    <!-- Helps the layout fit phone and tablet screens. -->
    <meta name="viewport" content="width=device-width, initial-scale=1
    <title>Frame — Videos worth your time</title>

    <!-- These files hold the styling and JavaScript separately from t
    "stylesheet" href="styles.css" />
```

Changes +620

Write the complete code for my styles.css file. Style the video-sharing homepage with a modern dark theme, a header, a sidebar, and a responsive grid of video cards. Make it look clean and beginner-friendly. The HTML already links to this file. Give me the entire code in one code block.

Thought for 18s

CSS

```css
/* Shared colors and fonts for the whole page. */
:root {
  color-scheme: dark;
  font-family: Arial, Helvetica, sans-serif;
  background: #10110f;
  color: #f3f1e9;

  --background: #10110f;
  --surface: #191b18;
  --surface-hover: #242620;
  --text: #f3f1e9;
  --muted: #96998f;
  --accent: #c4e86b;
  --border: #2b2d28;
}

/* Makes element sizing easier to control. */
* {
  box-sizing: border-box;
```

Changes +620

Write the complete code for my script.js file. For now, add a working search bar that filters video cards by title and displays a friendly message when no results match. Use beginner-friendly JavaScript comments. Give me the entire code in one code block.

Thought for 9s

This script uses the `#video-search` input, `.video-card` elements, and each card's `<h3>` title. Results update as you type, without needing a search button.

JavaScript

```
// Find the search box and all of the video cards on the page.
const searchInput = document.querySelector("#video-search");
const videoCards = document.querySelectorAll(".video-card");
const videoGrid = document.querySelector(".video-grid");

// Create a friendly message for when the search has no matches.
const noResultsMessage = document.createElement("p");
noResultsMessage.textContent = "No videos found. Try a different sear
noResultsMessage.hidden = true;

// Add the message after the video grid.
videoGrid.insertAdjacentElement("afterend", noResultsMessage);

// Listen each time someone types in the search box.
searchInput.addEventListener("input", () => {
  // Make the search case-inse ve and ignore extra spaces.
  const searchText = searchInput.value.trim().toLowerCase();
Cards = 0;
```

Changes +620

Help me add category filters to my existing video-sharing website. I am using HTML, CSS, and vanilla JavaScript.

Add buttons for All, Gaming, Music, Education, and Technology above the video grid. When a user clicks a category, show only videos in that category. Make sure the existing search bar still works together with the category filters.

Please tell me exactly what code I need to add or change in index.html, styles.css, and script.js. Keep the code beginner-friendly and explain where each change belongs. Do not replace my entire project unless necessary.

just now

Thought for 7s

I'll add the filters to the existing homepage and update the search logic so both controls can narrow the same video list. First I'm checking how the current HTML and JavaScript are structured.

My video-sharing website loads, but it immediately displays "No videos found" even when the search bar is empty. Please help me debug my existing HTML, CSS, and JavaScript without rewriting the whole project.

Check whether the JavaScript is incorrectly hiding all video cards when the search input is empty. Make sure all videos appear when the search bar is empty, and only matching videos appear when I type a search. Also make sure the "No videos found" message only appears when a search actually has no matches.

Please show me the exact code changes I need to make in script.js and explain where to put them.

> Read C:\Users\kernd\.copilot\repos\copilot-worktrees\video-sharing-app\ker...

Replace the contents of `script.js` with this. It treats an empty search as a match for every title, counts the videos that remain visible, and only shows the message when that count is zero. The selected category filter still applies—choose **All** to see every category.

JavaScript

```
// Find the search box, category buttons, video cards, and status text
const searchInput = document.querySelector("#video-search");
const categoryButtons = document.querySelectorAll(".category-button");
const videoCards = document.querySelectorAll(".video-card");
const noResultsMessage = document.querySelector(".no-results");
const videoCount = document.querySelector(".video-count");

// Start with the category marked active in the HTML, or use "all".
let activeCategory = document.querySelector(".category-button.active")
```

My video-sharing website is working, and I fixed the search bar so all videos appear when the search is empty. Now help me add category filters to my existing HTML, CSS, and JavaScript project.

Add buttons for All, Gaming, Music, Education, and Technology above the video grid. When a category is clicked, only videos in that category should appear. The All button should show every video. Make sure the category filters work together with my existing search bar and that the "No videos found" message still works correctly.

Please show me exactly what changes to make in index.html, styles.css, and script.js. Keep the code beginner-friendly, explain where each change goes, and do not rewrite files unnecessarily.

Your current workspace already has category filters in all three files. The buttons sit above the grid, every video card has a category, and the JavaScript combines category selection with search. Check that the corresponding code looks like this; don't add duplicate CSS rules if they're already there.

`index.html` — **above** `.video-grid`, add or keep the buttons:

HTML

```
<div class="category-filters" role="group" aria-label="Filter videos
  <button class="category-button active" type="button" data-category="
  <button class="category-button" type="button" data-category="gaming"
  <button class="category-butto type="button" data-category="music"
  <button class="category-butto type="button" data-category="educat
  <button class="category-button" type="button" data-category="techno
```

Changes +746

My video-sharing website now has a working homepage, search bar, and category filters. Help me add a like button to each video card using HTML, CSS, and vanilla JavaScript.

When someone clicks the like button, it should toggle between liked and unliked. The like count should increase when liked and decrease when unliked. Each video should have its own independent like button. Make the buttons visually show whether a video is liked.

Please explain exactly what changes I need to make in index.html, styles.css, and script.js. Keep the code beginner-friendly, preserve my existing search and category filters, and avoid rewriting the entire project.

just now

Thought for 6s

I'll add each like button inside its video card and wire it independently, without changing how search or category filters work. I'll first check the current card markup, stylesheet, and filter script so the additions fit what's already there.

Thought for 14s

The existing script already handles search and category filters. I'll leave that

My video-sharing website now has a homepage, working search, category filters, and individual like buttons. Help me add a video-viewing feature using my existing HTML, CSS, and vanilla JavaScript.

When a user clicks a video card, open a viewing section on the same page that displays the selected video's title, creator name, and description. If possible, include a playable sample video using a public video embed. Add a way to return to the video grid.

Please explain exactly what changes I need to make in index.html, styles.css, and script.js. Keep the code beginner-friendly, preserve my existing search, category filters, and like buttons, and do not rewrite the entire project unnecessarily.

just now

Thought for 5s

I'll add an in-page viewer that opens when the video thumbnail or title is selected, while keeping the like controls independent and leaving your filters in place. I'll check the current card markup and script first so the viewer uses your existing video data.

Update my existing README.md for my beginner video-sharing website project.

The project is built with HTML, CSS, and vanilla JavaScript. It has a dark-themed homepage with video cards, a search bar, category filters, like buttons, and a video-viewing section.

Write a clear, professional README with:

- Project title and overview
- Features
- Technologies used
- Instructions for opening and running the website locally
- Instructions for using the search, category filters, like buttons, and video-viewing feature

Keep the instructions beginner-friendly. Do not claim any feature works unless it is present in the existing project. Do not change my application code. Give me the complete README.md contents in one code block so I can replace the current README.
